In the Claims:

Cancel claims 116, 122, 127, 128, and 131, amend claim 96, 98-115, 117, 123, 125, 125, 129, 132, 136, 137, and add claims 139-143.

1-95. (Canceled).

- 96. (Currently amended). A microproportioning system, comprising:
 - a reservoir;
 - a micro-diaphragm pump having an entrance connected to the reservoir;
 - a proportioning port connected to an exit of the micro-diaphragm
 pump; and
 - a proportioning control means which is in an operative communication with the micro-diaphragm pump; and
 - a common printed circuit board;
 - wherein the micro-diaphragm pump and the reservoir are combined to form one constructional element exchangeably

- connected to an actuator module in one of a microsystem technology and hybrid technology; and
- wherein at least two <u>components of the microproportioning system</u>

 <u>selected from the group comprising of the proportioning controls</u>

 means, a display, and an operating means are accommodated on a

 <u>joint</u> the <u>common</u> printed-circuit board.
- 97. (Previously presented). The system according to claim 96, wherein the printed-circuit board is disposed in a middle region of the actuator module.
- 98. (Currently amended). A microproportioning system, comprising:
 - a reservoir;
 - a micro-diaphragm pump having an entrance connected to the reservoir;
 - a proportioning port connected to an exit of the micro-diaphragm
 pump; and

a proportioning control means which is in an operative communication with the micro-diaphragm pump; and

- an actuator module;
- wherein the micro-diaphragm pump and the reservoir are combined to form one constructional element exchangeably connected to [[an]] the actuator module in one of a microsystem technology and hybrid technology; and
- wherein a power supply is accommodated in a head region of the actuator module.
- 99. (Previously presented). A microproportioning system, comprising:
 - a reservoir;
 - a micro-diaphragm pump having an entrance connected to the reservoir;
 - a proportioning port connected to an exit of the micro-diaphragm
 pump; and

a proportioning control means operationally communicating with micro-diaphragm pump for controlling operation of the micro-diaphragm pump in one of two opposite pumping directions to thereby control displacement of an auxiliary liquid column from the reservoir for suction of liquid through the proportioning port and an expulsion of liquid from the proportioning port;

- wherein the proportioning control means controls a proportioned volume by controlling the displacement of the auxiliary liquid column along a distance between two sensors which are in an operative communication with the proportioning control means,
- wherein the distance between the two sensor corresponds to the
 proportioned volume and is adjustable one of manually and by a
 mechanical drive, and the two sensors detect meniscus of the
 auxiliary liquid column along a displacement length, and
- wherein the mechanical drive includes a screw having a servodrive and a screw nut, with one of the two sensors being mounted on the screw.

- 100. (Currently amended) A microproportioning system, comprising:
 - a reservoir with a to-be-metered liquid;
 - a micro-diaphragm pump having an entrance connected to the reservoir;
 - an open jet proportioner having an entrance connected to an exit of the micro-diaphragm pump;
 - a proportioning port connected to an exit of the open jet proportioner; and
 - a proportioning control means operatively communicating with the
 micro-diaphragm pump and the open-jet proportioner,
 - wherein the reservoir is provided with at least one component of
 the microproportioning system selected from the group comprising
 of cooling means and a heat insulation for the to-be-metered liquid.
- 101. (Currently amended). A microproportioning system, comprising:
 - a reservoir with a to-be-metered liquid;

- a micro-diaphragm pump having an entrance connected to the reservoir;
- an open jet proportioner having an entrance connected to an exit of the micro-diaphragm pump;
- a proportioning port connected to an exit of the open jet proportioner;
- a proportioning control means operatively communicating with the
 micro-diaphragm pump and the open-jet proportioner; and
- <u>a heating</u> means provided at least in one of <u>the components of the</u>

 <u>microproportioning system selected from the group comprising</u> the

 micro-diaphragm pump, the open jet proportioner, and connecting

 lines for heating the to-be-metered liquid.
- 102. (Previously presented). A microproportioning system comprising:
 - a reservoir with a to-be-metered liquid;

- a micro-diaphragm pump having an entrance connected to the reservoir;
- an open jet proportioner having an entrance connected to an exit of the micro-diaphragm pump;
- a proportioning port connected to an exit of the open jet proportioner; and
- a proportioning control means operatively communicating with the micro-diaphragm pump and the open-jet proportioner.
- 103. (Currently amended) The system according to claim 102, wherein the proportioning control means, for filling the open jet proportioner with the liquid from the reservoir, is adapted to place places the open jet proportioner in an non-operative state[[,]] and to control controls the micro-diaphragm pump so that it pumps the liquid in a first direction from the reservoir into the open jet proportioner.
- 104. (Currently amended) The system according to claim 102, wherein the micro-diaphragm pump is capable of pumping liquid in a first direction

in which it pumps liquid from the reservoir, and in a second direction in which it pumps liquid in the reservoir, and wherein for filing filling the open jet proportioner, the micro-diaphragm pump, and the reservoir at least partially with liquid through the proportioning port, the proportioning control means is adapted to place places the open jet proportioner in a non-operative state, and to actuate actuates the micro-diaphragm pump so that it is capable of pumping liquid in the second direction opposite the first direction.

- 105. (Currently amended) The system according to claim 102, wherein the proportioning control means is adapted to place places the microdiaphragm pump into a non-operative state for delivery of liquid from the proportioning port in form of an open jet.
- 106. (Currently amended) The system according to claim 105, wherein the proportioning control means is adapted to place places the microdiaphragm pump into an non-operative state for delivery of liquid in form of an open jet.

- 107. (Currently amended) The system according to claim 105, wherein the proportioning control means is adapted to control eontrols a volume being proportioned for delivery in form of an open jet by controlling a displacement volume of the open-jet proportioner.
- 108. (Currently amended) The system according to claim 105, wherein the proportioning control means is adapted to control controls a volume being proportioned for delivery in form of open jet by controlling one of a stroke volume and stroke volumes of the micro-diaphragm pump when filling the open-jet proportioner.
- 109. (Currently amended) The system according to claim 102, wherein the proportioning control means is adapted to place places the open jet proportioner in a non-operative state[[,]] and to control controls the micro-diaphragm pump so that it pumps liquid out of the proportioning port, draining the proportioning port.
- 110. (Currently amended) The system according to claim 109, wherein the proportioning control means <u>is adapted to control controls</u> a volume

- being proportioned of the liquid being drained by controlling one of stroke volume and stroke volumes of the micro-diaphragm pump.
- 111. (Currently amended) The system according to claim 102, wherein the proportioning control means is adapted to control controls displacement of an auxiliary liquid column from the reservoir for effecting one of the suction of liquid via the proportioning port and expulsion of liquid from the proportioning port by controlling operation of the micro-diaphragm pump in one of first direction in which the micro-diaphragm pump pumps liquid from the reservoir, and second direction opposite to the first direction, and by placing the open-jet proportioner into a non-operative position thereof.
- 112. (Currently amended) The system according to claim 111 wherein the proportioning control means is adapted to control controls a volume of a suction liquid and expulsion liquid being proportioned of the liquid being one of drawn in an expelled by controlling one of a stroke volume and stroke volumes of the micro-diaphragm pump.

- 113. (Currently amended) The system according to claim 102, wherein at least two components of the system selected from the group comprising of the micro-diaphragm pump, the open jet proportioner, the reservoir, and proportioning control means are combined to form one constructional element in one of microsystem technology or hybrid technology.
- 114. (Currently amended) A microproportioning system including
 - a reservoir with a to-be-metered liquid;
 - at least one system component selected from the group comprising

 of a micro-diaphragm pump having an entrance connected to the

 reservoir and an open jet proportioner having an entrance

 connected to one of an exit of the micro-diaphragm pump and the

 reservoir;
 - a proportioning port connected to <u>an exit of the at least</u> one of an
 exit of the micro-diaphragm pump and an exit of the open jet
 proportioner;

- a proportioning control means operative by communicating with
 the at least one of the micro-diaphragm pump and the an open jet
 proportioner; and
- wherein the at least one of [[a]] the micro-diaphragm pump and an the open jet proportioner and the reservoir are combined to form one constructional element exchangeably connected to an actuator module in one of microsystem technology and hybrid technology.
- 115. (Currently amended) The system according to claim 114, wherein the proportioning control means is adapted to control controls a volume being proportioned by controlling a stroke volume of the microdiaphragm pump.
- 116. (Canceled).
- 117. (Currently amended) The system according to claim <u>139</u> 116, wherein the sensor is associated with a dispensing tube for the liquid.
- 118. (Previously presented) The system according to claim 117, wherein the dispensing tube is connected to a constructional element.

- 119. (Previously presented) The system according to claim 118, wherein the constructional element is exchangeably connected to a base region of an actuator module.
- 120. (Previously presented) The system according to claim 119, wherein the proportioning control means is permanently connected to the actuator module, and the constructional element is separably connected to the proportioning control means by an electric contact.
- 121. (Previously presented) The system according to claim 119, wherein a sensor is permanently connected to the actuator module.
- 122. (Canceled).
- 123. (Currently amended) The system according to claim 122 140, wherein the printed-circuit board is disposed in a middle region of the actuator module.
- 124. (Previously presented) The system according to claim 119, wherein a power supply is accommodated in a head region of the actuator module.
- 125. (Currently amended) A microproportioning system, comprising.

- a reservoir with an auxiliary liquid;
- a micro-diaphragm pump having an entrance connected to the reservoir;
- a proportioning port connected to an exit of the micro-diaphragm
 pump; and
- a proportioning control means operatively communicating with the micro-diaphragm pump for controlling displacement of an auxiliary liquid column from the reservoir for effecting one of suction of the liquid through the proportioning port and expulsion of liquid from the proportioning port by controlling an operation of the micro-diaphragm pump in one of first direction in which the micro-diaphragm pump pumps the liquid from the reservoir, and second opposite direction in which the liquid is sucked into the reservoir, at least partially.
- 126. (Currently amended) The system according to claim 125, wherein the proportioning control means is adapted to control controls a volume

being proportioned by controlling a stroke volume of the microdiaphragm pump.

- 127. (Canceled).
- 128. (Canceled).
- 129. (Currently amended). The system according to claim 125, wherein at least two system components selected from the group comprising of the micro-diaphragm pump, the reservoir, and the proportioning control means are combined to form a constructional element in one of microsystem technology and hybrid technology.
- 130. (Previously presented). The system according to claim 102, wherein the reservoir is precharged with liquid.
- 131. (Canceled).
- 132. (Currently amended). The system according to claim 102, wherein the proportioning port <u>is formed by has</u> a nozzle shape.

- 133. (Previously presented). The system according to claim 102, wherein the proportioning port is formed at an exchangeable pipette tip.
- 134. (Previously presented). The system according to claim 102, wherein there is provided a constructional element exchangeably connected to an actuator module.
- 135. (Previously presented). The system according to claim 102, wherein the reservoir is connected to an entrance of the open jet proportioner via a feeding capillary.
- 136. (Currently amended). The system according to claim 102, further comprising a system component selected from the group comprising one of mechanical closure and fluid-based closure and provided between the reservoir and the proportioning port.
- 137. (Currently amended). The system according to claim 102, comprising several ducts connected with having one of a joint reservoir and or several reservoirs.

- 138. (Previously presented). The system according to claim 102, formed as a portable unit.
- 139. (New). A microproportioning system comprising:
 - a reservoir with a to-be-metered liquid;
 - at least one system component selected from the group comprising
 a micro-diaphragm pump having an entrance connected to the
 reservoir, and an open jet proportioner having an entrance
 connected to one of an exit of the micro-diaphragm pump and the
 reservoir;
 - a proportioning port connected to an exit of the at least one of the micro-diaphragm pump and the open jet proportioner;
 - a proportioning control means operative by communicating with at the least one of the micro-diaphragm pump and the open jet proportioner;

wherein at least one of a micro-diaphragm pump and an open jet proportioner and the reservoir are combined to form one constructional element exchangeably connected to an actuator module in one of microsystem technology and hybrid technology; and

 wherein the proportioning control means is connected to a sensor for detection of meniscus of the liquid at the beginning of a displacement length of the liquid for adjustment of an initial position for displacement of a liquid column.

140. (New). A microproportioning system comprising:

- a reservoir with a to-be-metered liquid;
- at least one system component selected from the group comprising
 a micro-diaphragm pump having an entrance connected to the
 reservoir and an open jet proportioner having an entrance
 connected to one of an exit of the micro-diaphragm pump and the
 reservoir;

- a proportioning port connected to an exit of the at least one of the micro-diaphragm pump and the open jet proportioner;
- a proportioning control means operative by communicating with at the least one of the micro-diaphragm pump and the open jet proportioner;
- a common printed circuit board; and
- an actuator module;
- wherein at least one of a micro-diaphragm pump and an open jet
 proportioner and the reservoir are combined to form one
 constructional element exchangeably connected to the actuator
 module in one of microsystem technology and hybrid technology;
- wherein at least one system component selected from the group comprising the proportioning control means, display, and operating means is accommodated on the common printed-circuit board.

- 141. (New). A microproportioning system, comprising:
 - a reservoir with an auxiliary liquid;
 - a micro-diaphragm pump having an entrance connected to the reservoir;
 - a proportioning port connected to an exit of the micro-diaphragm
 pump; and
 - a proportioning control means operatively communicating with the micro-diaphragm pump for controlling displacement of an auxiliary liquid column from the reservoir for effecting one of suction of the liquid through the proportioning port and expulsion of liquid from the proportioning port by controlling an operation of the micro-diaphragm pump in one of first direction in which the micro-diaphragm pump pumps the liquid from the reservoir, and second opposite direction in which the liquid is sucked in the reservoir, at least partially;

- wherein the proportioning control means is connected to sensors
 for detection of meniscus of the liquid at beginning of a
 displacement length of the liquid for adjustment of an initial
 position for displacement of an auxiliary liquid column.
- 142. (New). A microproportioning system, comprising.
 - a reservoir with an auxiliary liquid;
 - a micro-diaphragm pump having an entrance connected to the reservoir;
 - a proportioning port connected to an exit of the micro-diaphragm pump; and
 - a proportioning control means operatively communicating with the micro-diaphragm pump for controlling displacement of an auxiliary liquid column from the reservoir for effecting one of suction of the liquid through the proportioning port and expulsion of liquid from the proportioning port by controlling an operation of the micro-diaphragm pump in one of first direction in which the

micro-diaphragm pump pumps the liquid from the reservoir, and second opposite direction in which the liquid is sucked into the reservoir, at least partially;

- wherein the proportioning control means is adapted to control a volume being proportioned by controlling a stroke volume of the micro-diaphragm pump; and
- wherein the proportioning control means is adapted to determine
 the volume being proportioned on basis of calibration of the stroke
 volume that it establishes by displacing an auxiliary liquid column
 by the micro-diaphragm pump along with a calibration length
 between two sensors operatively connected with the proportioning
 control means for detection of meniscus of an auxiliary liquid
 column.

143. (New). A microproportioning system comprising:

a reservoir with a to-be-metered liquid;

a micro-diaphragm pump having an entrance connected to the reservoir;

- an open jet proportioner having an entrance connected to an exit of the micro-diaphragm pump;
- a proportioning port connected to an exit of the open jet proportioner; and
- a proportioning control means operatively communicating with the micro-diaphragm pump and the open-jet proportioner;
- wherein the reservoir has a capillary balance system.
